

This is how we hear!

The ear is one of our five sense organs.

Hearing, which is the perception of sounds and voices, takes place via the ear.

Sounds generate sound waves, which are collected by your ear.

Here, you can see what parts of the ear there are and what they each do.

Information Sheet

The pinna and the auditory canal form the outer ear. The middle ear contains the eardrum and the ossicles (malleus, incus, and stapes). In addition to the cochlea, the inner ear also contains the sense of balance. It helps us to maintain our balance.

Color the three areas in different colors:

Outer ear = red

Middle ear = green

Inner ear = blue
